

WHAT IS CLAIMED IS:

1. An image sensing system comprising at least one image sensing apparatus and at least one communication apparatus, wherein

5       said communication apparatus comprises  
          transmission means for transmitting an operating  
          status of said communication apparatus to said image  
          sensing apparatus; and  
          said image sensing apparatus comprises  
10       image sensing means,  
          reception means for receiving the operating  
          status transmitted from said transmission means,  
          first status determination means for determining  
          the operating status of said communication apparatus,  
15       which is received by said reception means, and  
          display means for displaying the operating status  
          of said communication apparatus in accordance with a  
          determination result by said first status determination  
          means.

20       2. The system according to claim 1, wherein said  
          image sensing apparatus executes authentication  
          processing for said communication apparatus, and when  
          authentication is successful, allows said display means  
          to display the operating status of said communication  
25       apparatus.

3. The system according to claim 1, wherein said  
communication apparatus executes authentication

processing for said image sensing apparatus, and when authentication is successful, transmits the operating status to said image sensing apparatus.

4. The system according to claim 1, wherein

5 said image sensing apparatus further comprises second status determination means for determining an operating status of said image sensing apparatus, and

the operating status of said communication apparatus includes at least one of an operating status  
10 of a power source function and an operating status of a communication function of said communication apparatus, the operating status of said image sensing apparatus is an operating status of an image sensing switch of said image sensing apparatus, and said display means  
15 displays at least one of the operating status of the power source function and the operating status of the communication function in accordance with a determination result of the status of the image sensing switch by said second status determination means.

20 5. The system according to claim 4, wherein when the determination result by said second status determination means represents that image sensing is being prepared for or image sensing is progressing, display of the operating status of said communication  
25 apparatus by said display means is stopped.

6. The system according to claim 4, wherein when the determination result by said second status

determination means represents that image sensing is being prepared for or image sensing is progressing, frequency of display of the operating status of said communication apparatus by said display means is made

- 5 lower than that when image sensing is not being prepared for or image sensing is not progressing.

7. The system according to claim 4, wherein the operating status of the communication function includes a call termination notification status.

- 10 8. The system according to claim 4, wherein the operating status of said image sensing apparatus includes at least one of an operating status of a power source function and an operating status of an image sensing function of said image sensing apparatus.

- 15 9. The system according to claim 8, wherein the operating status of the power source function is a status of a power switch of said image sensing apparatus, and

- 20 the operating status of the image sensing function is at least one of operating statuses of an image sensing mode, photometry mode, single shot/sequential image sensing/self image sensing mode, auto focus mode, distance measurement point selection, the number of recorded images, the number of recordable  
25 images, shutter speed setting, f number setting, exposure compensation, flash illumination, remaining battery level detection, error state detection, and

communication.

10. The system according to claim 1, wherein said display means for displaying the operating status of said communication apparatus is used for image sensing  
5 by said image sensing apparatus.

11. An image sensing system comprising at least one image sensing apparatus and at least one communication apparatus, wherein:

10 said image sensing apparatus comprises  
image sensing means,  
status determination means for determining an  
operating status of said image sensing apparatus,  
first transmission means for transmitting a  
determination result by said status determination means  
15 to said communication apparatus,  
first reception means for receiving an operating  
status of said communication apparatus, and  
display means; and  
said communication apparatus comprises  
20 second reception means for receiving the  
determination result transmitted from said first  
transmission means, and  
second transmission means for transmitting the  
operating status of said communication apparatus to  
25 said image sensing apparatus in accordance with the  
determination result received by said second reception  
means,

said display means displaying the operating status of said communication apparatus, which is received by said first reception means.

12. The system according to claim 11, wherein said

5 image sensing apparatus executes authentication processing for said communication apparatus, and when authentication is successful, allows said display means to display the operating status of said communication apparatus.

10 13. The system according to claim 11, wherein said communication apparatus executes authentication processing for said image sensing apparatus, and when authentication is successful, transmits the operating status to said image sensing apparatus.

15 14. The system according to claim 11, wherein the operating status of said communication apparatus includes at least one of an operating status of a power source function and an operating status of a communication function of said communication apparatus,  
20 the operating status of said image sensing apparatus is an operating status of an image sensing switch of said image sensing apparatus, and said display means displays at least one of the operating status of the power source function and the operating status of the  
25 communication function in accordance with a determination result of the status of the image sensing switch by said status determination means.

15. The system according to claim 14, wherein when the determination result by said status determination means represents that image sensing is being prepared for or image sensing is progressing, transmission of  
5 the operating status of said communication apparatus by said second transmission means is stopped.
16. The system according to claim 14, wherein when the determination result by said status determination means represents that image sensing is being prepared  
10 for or image sensing is progressing, frequency of transmission of the operating status of said communication apparatus by said second transmission means is made lower than that when image sensing is not being prepared for or image sensing is not progressing.
- 15 17. The system according to claim 11, wherein the operating status of the communication function includes a call termination notification status.
18. The system according to claim 11, wherein the operating status of said image sensing apparatus  
20 includes at least one of an operating status of a power source function and an operating status of an image sensing function of said image sensing apparatus.
19. The system according to claim 18, wherein  
the operating status of the power source function  
25 is a status of a power switch of said image sensing apparatus, and  
the operating status of the image sensing

- function is at least one of operating statuses of an image sensing mode, photometry mode, single shot/sequential image sensing/self image sensing mode, auto focus mode, distance measurement point selection,
- 5 the number of recorded images, the number of recordable images, shutter speed setting, f number setting, exposure compensation, flash illumination, remaining battery level detection, error state detection, and communication.
- 10 20. The system according to claim 11, wherein said display means for displaying the operating status of said communication apparatus is used for image sensing by said image sensing apparatus.
21. A control method for an image sensing system
- 15 comprising at least one image sensing apparatus and at least one communication apparatus, comprising:
- the transmission step of transmitting an operating status of the communication apparatus to the image sensing apparatus;
- 20 the reception step of receiving the operating status transmitted in the transmission step;
- the first status determination step of determining the operating status of the communication apparatus, which is received in the reception step; and
- 25 the display step of displaying the operating status of the communication apparatus in accordance with a determination result in the first status

determination step.

22. The method according to claim 21 further comprising the step of executing authentication processing for the communication apparatus in the image

5 sensing apparatus,

wherein when authentication is successful, the operating status of the communication apparatus is allowed to be displayed in the display step.

23. The method according to claim 21 further

10 comprising the step of executing authentication processing for the image sensing apparatus in the communication apparatus,

wherein when authentication is successful, the operating status is transmitted to the image sensing  
15 apparatus.

24. The method according to claim 21 further comprising the second status determination step of determining an operating status of the image sensing apparatus in the image sensing apparatus,

20 wherein the operating status of the communication apparatus includes at least one of an operating status of a power source function and an operating status of a communication function of the communication apparatus, the operating status of the image sensing apparatus is  
25 an operating status of an image sensing switch of the image sensing apparatus, and at least one of the operating status of the power source function and the

operating status of the communication function is displayed in the display step in accordance with a determination result of the status of the image sensing switch in the second status determination step.

5 25. The method according to claim 24, wherein when the determination result in the second status determination step represents that image sensing is being prepared for or image sensing is progressing, display of the operating status of the communication  
10 apparatus in the display step is stopped.

26. The method according to claim 24, wherein when the determination result in the second status determination step represents that image sensing is being prepared for or image sensing is progressing,  
15 frequency of display of the operating status of the communication apparatus in the display step is made lower than that when image sensing is not being prepared for or image sensing is not progressing.

27. The method according to claim 24, wherein the  
20 operating status of the communication function includes a call termination notification status.

28. The method according to claim 24, wherein the operating status of the image sensing apparatus includes at least one of an operating status of a power  
25 source function and an operating status of an image sensing function of the image sensing apparatus.

29. The method according to claim 28, wherein

the operating status of the power source function  
is a status of a power switch of the image sensing  
apparatus, and

the operating status of the image sensing  
5 function is at least one of operating statuses of an  
image sensing mode, photometry mode, single  
shot/sequential image sensing/self image sensing mode,  
auto focus mode, distance measurement point selection,  
the number of recorded images, the number of recordable  
10 images, shutter speed setting, f number setting,  
exposure compensation, flash illumination, remaining  
battery level detection, error state detection, and  
communication.

30. A control method for an image sensing system  
15 comprising at least one image sensing apparatus and at  
least one communication apparatus, comprising:

the status determination step of determining an  
operating status of the image sensing apparatus;

the first transmission step of transmitting a  
20 determination result in the determination step to the  
communication apparatus;

the first reception step of receiving an  
operating status of the communication apparatus;

the second reception step of receiving the  
25 determination result transmitted in the first  
transmission step;

the second transmission step of transmitting the

operating status of the communication apparatus to the image sensing apparatus in accordance with the determination result received in the second reception step; and

- 5           the display step of displaying the operating status of the communication apparatus, which is received in the first reception step.

31. The method according to claim 30 further comprising the step of executing authentication processing for the communication apparatus in the image sensing apparatus,

          wherein when authentication is successful, the operating status of the communication apparatus is allowed to be displayed in the display step.

- 15 32. The method according to claim 30, further comprising the step of executing authentication processing for the image sensing apparatus in the communication apparatus,

- wherein when authentication is successful, the operating status is transmitted to the image sensing apparatus.

33. The method according to claim 30, wherein the operating status of the communication apparatus includes at least one of an operating status of a power source function and an operating status of a communication function of the communication apparatus, the operating status of the image sensing apparatus is

34. The method according to claim 33, wherein when the determination result in the status determination

35. The method according to claim 33, wherein when

36. The method according to claim 33, wherein the operating status of the communication function includes a call termination notification status.

- 165 -

source function and an operating status of an image sensing function of the image sensing apparatus.

38. The method according to claim 37, wherein  
the operating status of the power source function  
5 is a status of a power switch of the image sensing apparatus, and

the operating status of the image sensing function is at least one of operating statuses of an image sensing mode, photometry mode, single  
10 shot/sequential image sensing/self image sensing mode, auto focus mode, distance measurement point selection, the number of recorded images, the number of recordable images, shutter speed setting, f number setting, exposure compensation, flash illumination, remaining  
15 battery level detection, error state detection, and communication.

39. A computer program product comprising a computer usable medium having computer readable program code means embodied in said medium for controlling an image  
20 sensing system comprising at least one image sensing apparatus and at least one communication apparatus, said product including:

first computer readable program code means for transmitting an operating status of the communication  
25 apparatus to the image sensing apparatus;

second computer readable program code means for receiving the operating status;

third computer readable program code means for determining the operating status of the communication apparatus; and

- fourth computer readable program code means for
- 5 displaying the operating status of the communication apparatus in accordance with a determination result by said third computer readable program code means.

40. A computer program product comprising a computer usable medium having computer readable program code
- 10 means embodied in said medium for controlling an image sensing system comprising at least one image sensing apparatus and at least one communication apparatus, said product including:

- first computer readable program code means for
- 15 determining an operating status of the image sensing apparatus;

- second computer readable program code means for transmitting a determination result by said first computer readable program code means to the
- 20 communication apparatus;

third computer readable program code means for receiving an operating status of the communication apparatus;

- fourth computer readable program code means for
- 25 receiving the transmitted determination result;

fifth computer readable program code means for transmitting the operating status of the communication

apparatus to the image sensing apparatus in accordance with the received determination result; and

sixth computer readable program code means for displaying the received operating status of the communication apparatus.

41. An image sensing apparatus capable of transmitting image data to an external communication apparatus by communication, comprising:

image sensing means;

reception means for receiving an operating status of said external communication apparatus from said external communication apparatus;

first status determination means for determining the operating status of said external communication apparatus, which is received by said reception means; and

display means for displaying the operating status of said external communication apparatus in accordance with a determination result by said first status determination means.

42. The apparatus according to claim 41, wherein the image sensing apparatus executes authentication processing for said external communication apparatus, and when authentication is successful, allows said display means to display the operating status of said external communication apparatus.

43. The apparatus according to claim 41 further

comprising second status determination means for determining an operating status of the image sensing apparatus,

wherein the operating status of said external communication apparatus includes at least one of an operating status of a power source function and an operating status of a communication function of said external communication apparatus, the operating status of the image sensing apparatus is an operating status of an image sensing switch of the image sensing apparatus, and said display means displays at least one of the operating status of the power source function and the operating status of the communication function in accordance with a determination result of the status of the image sensing switch by said second status determination means.

44. The apparatus according to claim 43, wherein when the determination result by said second status determination means represents that image sensing is being prepared for or image sensing is progressing, display of the operating status of said external communication apparatus by said display means is stopped.

45. The apparatus according to claim 43, wherein when the determination result by said second status determination means represents that image sensing is being prepared for or image sensing is progressing,

frequency of display of the operating status of said external communication apparatus by said display means is made lower than that when image sensing is not being prepared for or image sensing is not progressing.

- 5 46. The apparatus according to claim 43, wherein the operating status of the communication function includes a call termination notification status.

47. The apparatus according to claim 43, wherein the operating status of the image sensing apparatus  
10 includes at least one of an operating status of a power source function and an operating status of an image sensing function of the image sensing apparatus.

48. The apparatus according to claim 47, wherein the operating status of the power source function  
15 is a status of a power switch of the image sensing apparatus, and

- the operating status of the image sensing function is at least one of operating statuses of an image sensing mode, photometry mode, single  
20 shot/sequential image sensing/self image sensing mode, auto focus mode, distance measurement point selection, the number of recorded images, the number of recordable images, shutter speed setting, f number setting, exposure compensation, flash illumination, remaining  
25 battery level detection, error state detection, and communication.

49. The apparatus according to claim 41, wherein said

display means for displaying the operating status of said external communication apparatus comprises display means used for image sensing by the image sensing apparatus.

- 5 50. An image sensing apparatus capable of transmitting image data to an external communication apparatus by communication, comprising:

image sensing means;

- 10 status determination means for determining an operating status of the image sensing apparatus;

transmission means for transmitting a determination result by said determination means to said external communication apparatus;

- 15 reception means for receiving an operating status of said external communication apparatus; and

display means for displaying the operating status of said external communication apparatus, which is received by said reception means.

51. The apparatus according to claim 50, wherein the  
20 image sensing apparatus executes authentication processing for said external communication apparatus, and when authentication is successful, allows said display means to display the operating status of said external communication apparatus.

- 25 52. The apparatus according to claim 50, wherein the operating status of said external communication apparatus includes at least one of an operating status

- of a power source function and an operating status of a communication function of said external communication apparatus, the operating status of the image sensing apparatus is an operating status of an image sensing switch of the image sensing apparatus, and said display means displays at least one of the operating status of the power source function and the operating status of the communication function in accordance with a determination result of the status of the image sensing switch by said status determination means.
53. The apparatus according to claim 52, wherein when the determination result by said status determination means represents that image sensing is being prepared for or image sensing is progressing, transmission of the operating status of said external communication apparatus is stopped.
54. The apparatus according to claim 52, wherein when the determination result by said status determination means represents that image sensing is being prepared for or image sensing is progressing, frequency of transmission of the operating status of said external communication apparatus is made lower than that when image sensing is not being prepared for or image sensing is not progressing.
55. The apparatus according to claim 52, wherein the operating status of the communication function includes a call termination notification status.

56. The apparatus according to claim 50, wherein the operating status of the image sensing apparatus includes at least one of an operating status of a power source function and an operating status of an image  
5 sensing function of the image sensing apparatus.
57. The apparatus according to claim 56, wherein the operating status of the power source function is a status of a power switch of the image sensing apparatus, and  
10 the operating status of the image sensing function is at least one of operating statuses of an image sensing mode, photometry mode, single shot/sequential image sensing/self image sensing mode, auto focus mode, distance measurement point selection,  
15 the number of recorded images, the number of recordable images, shutter speed setting, f number setting, exposure compensation, flash illumination, remaining battery level detection, error state detection, and communication.
- 20 58. The apparatus according to claim 50, wherein said display means for displaying the operating status of said external communication apparatus comprises display means used for image sensing by the image sensing apparatus.
- 25 59. A control method for an image sensing apparatus capable of transmitting image data to an external communication apparatus by communication, comprising:

the reception step of receiving an operating status of the external communication apparatus, which is transmitted from the external communication apparatus;

5        the first status determination step of determining the operating status of the external communication apparatus, which is received in the reception step; and

10        the display step of displaying the operating status of the external communication apparatus in accordance with a determination result in the first status determination step.

60.    The method according to claim 59 further comprising the step of executing authentication  
15        processing for the external communication apparatus, wherein when authentication is successful, the operating status of the external communication apparatus is allowed to be displayed in the display step.

20        61.    The method according to claim 59 further comprising the second status determination step of determining an operating status of the image sensing apparatus,

25        wherein the operating status of the external communication apparatus includes at least one of an operating status of a power source function and an operating status of a communication function of the

external communication apparatus, the operating status of the image sensing apparatus is an operating status of an image sensing switch of the image sensing apparatus, and at least one of the operating status of

5 the power source function and the operating status of the communication function is displayed in the display step in accordance with a determination result of the status of the image sensing switch in the second status determination step.

10 62. The method according to claim 61, wherein when the determination result in the second status determination step represents that image sensing is being prepared for or image sensing is progressing, display of the operating status of the external

15 communication apparatus in the display step is stopped.

63. The method according to claim 61, wherein when the determination result in the second status determination step represents that image sensing is being prepared for or image sensing is progressing,

20 frequency of display of the operating status of the external communication apparatus in the display step is made lower than that when image sensing is not being prepared for or image sensing is not progressing.

64. The method according to claim 61, wherein the

25 operating status of the communication function includes a call termination notification status.

65. The method according to claim 61, wherein the

operating status of the image sensing apparatus includes at least one of an operating status of a power source function and an operating status of an image sensing function of the image sensing apparatus.

- 5 66. The method according to claim 65, wherein the operating status of the power source function is a status of a power switch of the control method for the image sensing apparatus, and

- the operating status of the image sensing  
10 function is at least one of operating statuses of an image sensing mode, photometry mode, single shot/sequential image sensing/self image sensing mode, auto focus mode, distance measurement point selection, the number of recorded images, the number of recordable  
15 images, shutter speed setting, f number setting, exposure compensation, flash illumination, remaining battery level detection, error state detection, and communication.

67. A control method for an image sensing apparatus  
20 capable of transmitting image data to an external communication apparatus by communication, comprising:

the status determination step of determining an operating status of the image sensing apparatus;

- the transmission step of transmitting a  
25 determination result in the determination step to the external communication apparatus;

the reception step of receiving an operating

status of the external communication apparatus; and

the display step of displaying the operating status of the external communication apparatus, which is received in the reception step.

5 68. The method according to claim 67 further comprising the step of executing authentication processing for the external communication apparatus,

wherein when authentication is successful, the operating status of the external communication  
10 apparatus is allowed to be displayed in the display step.

69. The method according to claim 67, wherein  
the operating status of the external  
communication apparatus includes at least one of an  
15 operating status of a power source function and an operating status of a communication function of the external communication apparatus, the operating status of the image sensing apparatus is an operating status of an image sensing switch of the image sensing  
20 apparatus, and at least one of the operating status of the power source function and the operating status of the communication function is displayed in the display step in accordance with a determination result of the status of the image sensing switch in the status  
25 determination step.

70. The method according to claim 69, wherein when the determination result in the status determination

step represents that image sensing is being prepared for or image sensing is progressing, transmission of the operating status of the external communication apparatus is stopped.

- 5 71. The method according to claim 69, wherein when the determination result in the status determination step represents that image sensing is being prepared for or image sensing is progressing, frequency of transmission of the operating status of the external communication apparatus is made lower than that when image sensing is not being prepared for or image sensing is not progressing.

- 10 72. The method according to claim 69, wherein the operating status of the communication function includes a call termination notification status.

- 15 73. The method according to claim 67, wherein the operating status of the image sensing apparatus includes at least one of an operating status of a power source function and an operating status of an image sensing function of the image sensing apparatus.

- 20 74. The method according to claim 73, wherein the operating status of the power source function is a status of a power switch of the control method for the image sensing apparatus, and

- 25 the operating status of the image sensing function is at least one of operating statuses of an image sensing mode, photometry mode, single

shot/sequential image sensing/self image sensing mode,  
auto focus mode, distance measurement point selection,  
the number of recorded images, the number of recordable  
images, shutter speed setting, f number setting,  
5 exposure compensation, flash illumination, remaining  
battery level detection, error state detection, and  
communication.

75. A computer program product comprising a computer  
usable medium having computer readable program code  
10 means embodied in said medium for controlling an image  
sensing apparatus capable of transmitting image data to  
an external communication apparatus by communication,  
said product including:

first computer readable program code means for  
15 receiving an operating status of the external  
communication apparatus, which is transmitted from the  
external communication apparatus;

second computer readable program code means for  
determining the received operating status of the  
20 external communication apparatus; and

third computer readable program code means for  
displaying the operating status of the external  
communication apparatus in accordance with a  
determination result by said second computer readable  
25 program code means.

76. A computer program product comprising a computer  
usable medium having computer readable program code

means embodied in said medium for controlling an image sensing apparatus capable of transmitting image data to an external communication apparatus by communication, said product including:

5 first computer readable program code means for determining an operating status of the image sensing apparatus;

second computer readable program code means for transmitting a determination result by said first  
10 computer readable program code means to the external communication apparatus;

third computer readable program code means for receiving an operating status of the external communication apparatus; and

15 fourth computer readable program code means for displaying the received operating status of the external communication apparatus.

77. A communication apparatus capable of receiving image data from an external image sensing apparatus by  
20 communication, comprising transmission means for transmitting an operating status of said communication apparatus to said external image sensing apparatus.

78. The apparatus according to claim 77, wherein the communication apparatus executes authentication  
25 processing for said external image sensing apparatus, and when authentication is successful, transmits the operating status to said external image sensing

apparatus.

79. The apparatus according to claim 77, wherein the operating status of the communication apparatus includes at least one of an operating status of a power source function and an operating status of a communication function of the communication apparatus.

80. The apparatus according to claim 79, wherein the operating status of the communication function includes a call termination notification status.

81. A communication apparatus capable of receiving image data from an external image sensing apparatus by communication, comprising:

reception means for receiving a control signal from said external image sensing apparatus; and

transmission means for transmitting an operating status of the communication apparatus to said external image sensing apparatus in accordance with the control signal received by said reception means.

82. The apparatus according to claim 81, wherein the communication apparatus executes authentication processing for said external image sensing apparatus, and when authentication is successful, transmits the operating status to said external image sensing apparatus.

83. The apparatus according to claim 81, wherein the control signal is a signal for permitting or inhibiting transmission of the operating status by said

transmission means.

84. The apparatus according to claim 81, wherein the control signal is a signal for controlling frequency of transmission of the operating status by said

5 transmission means.

85. The apparatus according to claim 81, wherein the operating status of the communication apparatus includes at least one of an operating status of a power source function and an operating status of a

10 communication function of the communication apparatus.

86. The apparatus according to claim 85, wherein the operating status of the communication function includes a call termination notification status.

87. A control method for a communication apparatus  
15 capable of receiving image data from an external image sensing apparatus by communication, comprising the transmission step of transmitting an operating status of the communication apparatus to the external image sensing apparatus.

20 88. The method according to claim 87 further comprising the step of executing authentication processing for the external image sensing apparatus, wherein when authentication is successful, the operating status is transmitted to the external image  
25 sensing apparatus.

89. The method according to claim 87, wherein the operating status of the communication apparatus

includes at least one of an operating status of a power source function and an operating status of a communication function of the communication apparatus.

90. The method according to claim 89, wherein the  
5 operating status of the communication function includes a call termination notification status.

91. A control method for a communication apparatus capable of receiving image data from an external image sensing apparatus by communication, comprising:

10 the reception step of receiving a control signal from the external image sensing apparatus; and  
the transmission step of transmitting an operating status of the communication apparatus to the external image sensing apparatus in accordance with the  
15 control signal received in the reception step.

92. The method according to claim 91 further comprising the step of executing authentication processing for the external image sensing apparatus,

wherein when authentication is successful, the  
20 operating status is transmitted to the external image sensing apparatus.

93. The method according to claim 91, wherein the control signal is a signal for permitting or inhibiting transmission of the operating status in the  
25 transmission step.

94. The method according to claim 91, wherein the control signal is a signal for controlling frequency of

transmission of the operating status in the  
transmission step.

95. The method according to claim 91, wherein the  
operating status of the communication apparatus

5 includes at least one of an operating status of a power  
source function and an operating status of a  
communication function of the communication apparatus.

96. The method according to claim 95, wherein the  
operating status of the communication function includes  
10 a call termination notification status.

97. An image sensing system comprising at least one  
image sensing apparatus and at least one communication  
apparatus, wherein

15 said image sensing apparatus comprises  
image sensing means, and  
transmission means for transmitting an operating  
status of said image sensing apparatus to said  
communication apparatus; and

20 said communication apparatus comprises  
reception means for receiving the operating  
status transmitted from said transmission means,  
status determination means for determining the  
operating status of said image sensing apparatus, which  
is received by said reception means, and

25 display means for displaying the operating status  
of said image sensing apparatus in accordance with a  
determination result by said status determination means.

98. The system according to claim 97, wherein the operating status of said image sensing apparatus is an operating status of a power source of said image sensing apparatus.

- 5 99. The system according to claim 98, wherein the operating status of the power source includes a status of a power switch and a remaining battery level status of said image sensing apparatus, and said display means displays the remaining battery
- 10 level status in accordance with a determination result of the status of the power switch.

100. The system according to claim 97, wherein the operating status of said image sensing apparatus includes an operating status of a power source and an
- 15 operating status of an image sensing function of said image sensing apparatus.

101. The system according to claim 100, wherein the operating status of the power source is a status of a power switch of said image sensing
- 20 apparatus,
- the operating status of the image sensing function is at least one of operating statuses of an image sensing mode, photometry mode, single shot/sequential image sensing/self image sensing mode,
- 25 auto focus mode, distance measurement point selection, the number of recorded images, the number of recordable images, shutter speed setting, f number setting,

exposure compensation, flash illumination, remaining battery level detection, error state detection, and communication, and

- said display means displays at least one of
- 5 operating statuses of the image sensing mode, photometry mode, single shot/sequential image sensing/self image sensing mode, auto focus mode, distance measurement point selection, the number of recorded images, the number of recordable images,
- 10 shutter speed setting, f number setting, exposure compensation, flash illumination, remaining battery level detection, error state detection, and communication in accordance with a determination result of the status of the power switch.
- 15 102. The system according to claim 97, wherein said communication apparatus executes authentication processing for said image sensing apparatus, and when authentication is successful, displays the operating status of said image sensing apparatus.
- 20 103. The system according to claim 97, wherein said communication apparatus further comprises means for communicating with an external apparatus other than said image sensing apparatus, and
- during communication between said communication
- 25 apparatus and said external apparatus, display of the operating status of said image sensing apparatus by said display means is stopped.

0050154.01701

104. The system according to claim 97, wherein said image sensing apparatus further comprises display means for displaying the operating status of said image sensing apparatus.

5 105. The system according to claim 97, wherein said transmission means transmits the operating status of said image sensing apparatus to said communication apparatus every time the operating status is acquired.

106. The system according to claim 97, wherein  
10 said image sensing apparatus transmits image data obtained by said image sensing means to said communication apparatus, and

said transmission means transmits the operating status to said communication apparatus in transmitting  
15 the image data.

107. A control method for an image sensing system comprising at least one image sensing apparatus and at least one communication apparatus, comprising:

the notification step of notifying the  
20 communication apparatus of an operating status of the image sensing apparatus;

the reception step of receiving, in the communication apparatus, the operating status transmitted in the notification step;

25 the determination step of determining, in the communication apparatus, the operating status of the image sensing apparatus, which is received in the

reception step; and

the display step of displaying the operating status of the image sensing apparatus in accordance with a determination result in the status determination step.

108. The method according to claim 107, wherein the operating status of the image sensing apparatus is an operating status of a power source of the image sensing apparatus.

109. The method according to claim 108, wherein the operating status of the power source includes a status of a power switch and a remaining battery level status of the image sensing apparatus, and in the display step, the remaining battery level status is displayed in accordance with a determination result of the status of the power switch.

110. The method according to claim 107, wherein the operating status of the image sensing apparatus includes an operating status of a power source and an operating status of an image sensing function of the image sensing apparatus.

111. The method according to claim 110, wherein the operating status of the power source is a status of a power switch of the image sensing apparatus, the operating status of the image sensing function is at least one of operating statuses of an image sensing mode, photometry mode, single

09350454, 051701

shot/sequential image sensing/self image sensing mode,  
auto focus mode, distance measurement point selection,  
the number of recorded images, the number of recordable  
images, shutter speed setting, f number setting,  
5 exposure compensation, flash illumination, remaining  
battery level detection, error state detection, and  
communication, and

in the display step, at least one of operating  
statuses of the image sensing mode, photometry mode,  
10 single shot/sequential image sensing/self image sensing  
mode, auto focus mode, distance measurement point  
selection, the number of recorded images, the number of  
recordable images, shutter speed setting, f number  
setting, exposure compensation, flash illumination,  
15 remaining battery level detection, error state  
detection, and communication is displayed in accordance  
with a determination result of the status of the power  
switch.

112. The method according to claim 107 further  
20 comprising the step of executing authentication  
processing for the image sensing apparatus in the  
communication apparatus,

wherein when authentication is successful, the  
operating status of the image sensing apparatus is  
25 displayed in the display step.

113. The method according to claim 107, wherein  
the communication apparatus comprises means for

communicating with an external apparatus other than the image sensing apparatus, and

during communication between the communication apparatus and the external apparatus, display of the operating status of the image sensing apparatus in the display step is stopped.

114. The method according to claim 107 further comprising the second display step of displaying the operating status of the image sensing apparatus in the image sensing apparatus.

115. The method according to claim 107, wherein the operating status of the image sensing apparatus is notified to the communication apparatus every time the operating status is acquired in the status notification step.

116. The method according to claim 107, wherein the image sensing apparatus transmits image data to the communication apparatus, and

the operating status is transmitted to the communication apparatus in transmitting the image data in the status notification step.

117. A computer program product comprising a computer usable medium having computer readable program code means embodied in said medium for controlling an image sensing system comprising at least one image sensing apparatus and at least one communication apparatus, said product including:

first computer readable program code means for notifying the communication apparatus of an operating status of the image sensing apparatus;

second computer readable program code means for  
5 receiving, in the communication apparatus, the transmitted operating status;

third computer readable program code means for determining, in the communication apparatus, the received operating status of the image sensing  
10 apparatus; and

fourth computer readable program code means for displaying the operating status of the image sensing apparatus in accordance with a determination result by said third computer readable program code means.

15 118. An image sensing apparatus capable of transmitting image data to an external communication apparatus by communication, comprising

image sensing means; and

transmission means for transmitting an operating  
20 status of the image sensing apparatus to said external communication apparatus.

119. The apparatus according to claim 118, wherein the operating status of the image sensing apparatus is an operating status of a power source of the image sensing  
25 apparatus.

120. The apparatus according to claim 119, wherein the operating status of the power source includes a status

of a power switch and a remaining battery level status of the image sensing apparatus.

121. The apparatus according to claim 118, wherein the operating status of the image sensing apparatus

5 includes an operating status of a power source and an operating status of an image sensing function of the image sensing apparatus.

122. The apparatus according to claim 121, wherein the operating status of the power source is a

10 status of a power switch of the image sensing apparatus, and

the operating status of the image sensing function is at least one of operating statuses of an image sensing mode, photometry mode, single  
15 shot/sequential image sensing/self image sensing mode, auto focus mode, distance measurement point selection, the number of recorded images, the number of recordable images, shutter speed setting, f number setting, exposure compensation, flash illumination, remaining  
20 battery level detection, error state detection, and communication.

123. The apparatus according to claim 118, wherein said transmission means transmits identification information used in authentication between the image  
25 sensing apparatus and said communication apparatus.

124. The apparatus according to claim 118 further comprising display means for displaying the operating

status of the image sensing apparatus.

125. The apparatus according to claim 118, wherein  
said transmission means transmits the operating status  
of the image sensing apparatus to said communication

5 apparatus every time the operating status is acquired.

126. The apparatus according to claim 118, wherein said transmission means transmits the operating status to said communication apparatus in transmitting the image data.

10 127. A control method for an image sensing apparatus  
capable of transmitting image data to an external  
communication apparatus by communication, comprising  
the notification step of notifying the external  
communication apparatus of an operating status of the  
15 image sensing apparatus.

128. The method according to claim 127, wherein the operating status of the image sensing apparatus is an operating status of a power source of the image sensing apparatus.

20 129. The method according to claim 128, wherein the  
operating status of the power source includes a status  
of a power switch and a remaining battery level status  
of the image sensing apparatus.

130. The method according to claim 127, wherein the  
25 operating status of the image sensing apparatus  
includes an operating status of a power source and an  
operating status of an image sensing function of the

image sensing apparatus.

131. The method according to claim 130, wherein  
the operating status of the power source is a  
status of a power switch of the image sensing apparatus,  
5 and

the operating status of the image sensing  
function is at least one of operating statuses of an  
image sensing mode, photometry mode, single  
shot/sequential image sensing/self image sensing mode,  
10 auto focus mode, distance measurement point selection,  
the number of recorded images, the number of recordable  
images, shutter speed setting, f number setting,  
exposure compensation, flash illumination, remaining  
battery level detection, error state detection, and  
15 communication.

132. The method according to claim 127, wherein  
identification information is transmitted in the  
notification step to be used in authentication between  
the image sensing apparatus and the communication  
20 apparatus.

133. The method according to claim 127 further  
comprising the display step of displaying the operating  
status of the image sensing apparatus.

134. The method according to claim 127, wherein the  
25 operating status of the image sensing apparatus is  
transmitted to the external communication apparatus in  
the notification step every time the operating status

is acquired.

135. The method according to claim 127, wherein the operating status is transmitted to the external communication apparatus in the notification step in  
5 transmitting the image data.

136. A computer program product comprising a computer usable medium having computer readable program code means embodied in said medium for controlling an image sensing apparatus capable of transmitting image data to  
10 an external communication apparatus by communication, said product including first computer readable program code means for notifying the external communication apparatus of an operating status of the image sensing apparatus.

15 137. A communication apparatus capable of receiving image data from an external image sensing apparatus by communication, comprising:

reception means for receiving an operating status of said external image sensing apparatus, which is  
20 transmitted from said external image sensing apparatus;

status determination means for determining the operating status of said external image sensing apparatus, which is received by said reception means;  
and

25 display means for displaying the operating status of said external image sensing apparatus in accordance with a determination result by said status

the number of recorded images, the number of recordable  
images, shutter speed setting, f number setting,  
exposure compensation, flash illumination, remaining  
battery level detection, error state detection, and  
5 communication, and

said display means displays at least one of  
operating statuses of the image sensing mode,  
photometry mode, single shot/sequential image  
sensing/self image sensing mode, auto focus mode,  
10 distance measurement point selection, the number of  
recorded images, the number of recordable images,  
shutter speed setting, f number setting, exposure  
compensation, flash illumination, remaining battery  
level detection, error state detection, and  
15 communication in accordance with a determination result  
of the status of the power switch.

142. The apparatus according to claim 137, wherein  
the communication apparatus executes  
authentication processing for said external image  
20 sensing apparatus, and

when authentication is successful, said display  
means displays the operating status of said external  
image sensing apparatus.

143. The apparatus according to claim 137 further  
25 comprising means for communicating with an external  
apparatus other than said external image sensing  
apparatus,

wherein during communication between the communication apparatus and said external apparatus, display of the operating status of said external image sensing apparatus by said display means is stopped.

- 5 144. A control method for a communication apparatus capable of receiving image data from an external image sensing apparatus by communication, comprising:

the reception step of receiving an operating status of the external image sensing apparatus, which  
10 is transmitted from the external image sensing apparatus;

the determination step of determining the operating status of the external image sensing apparatus, which is received in the reception step; and

- 15 the display step of displaying the operating status of the external image sensing apparatus in accordance with a determination result in the determination step.

145. The method according to claim 144, wherein the  
20 operating status of the external image sensing apparatus is an operating status of a power source of the external image sensing apparatus.

146. The method according to claim 145, wherein  
the operating status of the power source includes  
25 a status of a power switch and a remaining battery level status of the external image sensing apparatus, and

receiving an operating status of the external image sensing apparatus, which is transmitted from the external image sensing apparatus;

second computer readable program code means for  
5 determining the received operating status of the external image sensing apparatus; and

third computer readable program code means for displaying the operating status of the external image sensing apparatus in accordance with a determination  
10 result by said second computer readable program code means.
